

Task-4 Software Construction Tools Memory Scramble Game

Memory scramble is a game in which the player turns over face-down cards and tries to find matching pairs.

The game shall allow the player to configure the game's board_size in the form of nRows and nColumns, the size has to be even.

The game shall generate board_size / 2 different shapes/icons/images and randomly distribute these shapes/icons/images over the game board cells.

The game shall allow the player to configure a time out for the game.

The game shall display a countdown timer on the screen/display while the game is being played.

The game shall display a game-over message in case the countdown timer reaches zero and all cards have not been matched correctly.

The player shall be able to select two cells, trying to find a matching pair. The game shall face-up the face-down cards hosted inside the selected cells by the player. The game shall keep the matched cards faced-up till the complete set of cards completely matches each other.

A Team with a group of three (at most), and two (at least) required to develop such game based on the above mentioned requirements:

- A public github project must be created and used by the team to develop the game.
- A read-me or how to guide must be included in the repo to describe how to build and execute the game.
- You must make use of git repo as a configuration management wisely i.e. no one big commit/push for your implementation.

You should upload a single text file to the google classroom before **May 17, 2026 23:59 AM.** **ONLY ONE** team member should upload the file. It must contain the team names and ids as well as a link for the public github repo for the implementation.
